

MICROSOFT 365 COPILOT

# M365 Usage Dashboard

## Interpretation Guide

**Template version: August 27, 2026**

Companion pipeline: Purview\_M365\_Usage\_Bundle\_Explosion\_Processor\_v2.6.1.py

Audience: Customer Success Managers • Adoption Leads • Tenant Admins • ROI Advisors

# Agenda

- 1. What's new Current synthetic demo release
- 2. Five-minute orientation Reading order for time-pressed reviewers
- 3. Data model Fact tables, dimensions, helpers
- 4. Page walkthrough All 8 dashboard pages, in order
- **5. Methodology** Weighting, percentiles, prompts vs events
- **6. Data pipeline** Python v2.6.1 outputs and refresh
- **7. Measure glossary** Org • LP • OPT • CE measures
- **8. Appendix** Export formats and PDF conversion

# What's new in this demo release

The guide now reflects the current eight-page synthetic report and persisted control defaults.

- **License Optimizer** Separates inactive licensed users from ranked unlicensed assignment candidates.
- **Recommendations** Default weights are Teams 17%, Outlook 17%, Word 17%, Excel 17%, PowerPoint 16%, and Copilot 16%; tiers use P90 / P75 / P50.
- **Champions** Champion Tier offers Top 5%, Top 10%, and Top 20%; persisted defaults are Top 20%, 90 days, and Include Agents.
- **Enablement Strategy** Uses four cohort buttons and a user-level priority table; no scatter view is implied.
- **Synthetic demo** Cached identities use @example.com and all five source parameters use neutral demo paths.

# Five-minute orientation

If you only have five minutes, read these four pages in order:

| 1 STEP                                                                               | 2 STEP                                                                                                      | 3 STEP                                                                                   | 4 STEP                                                                                                   |
|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Executive Summary</b><br><br>Tenant snapshot — are people using M365 and Copilot? | <b>Copilot License Optimizer</b><br><br>Operational view: reclaim inactive seats, assign to top candidates. | <b>Copilot Champions</b><br><br>Top per-department users — pilot leads and co-promoters. | <b>Enablement Strategy Quadrant</b><br><br>2×2 of M365 baseline vs. Copilot intensity — plan sequencing. |

# Data model at a glance

Core import tables, the user dimension, and disconnected control tables.

## Core tables

- **EntraUsers** User dimension — Microsoft Graph / Entra ID export
- **M365Usage** Audit-event fact — Purview Unified Audit Log, rolled up by the Python pipeline
- **M365CopilotSessions** Session/prompt fact — from SessionStats.csv (v2.6.1+)

## Disconnected helpers (slicers)

- LP Weight Profiles [Balanced](#) / [Collaboration Focus](#) / [Content Creation Focus](#) / [Custom](#).
- Six Weight % tables Defaults: Teams 17%, Outlook 17%, Word 17%, Excel 17%, PowerPoint 16%, Copilot 16%.
- Inactivity Window [30](#) / [60](#) / [90](#) days.
- Lookback Window [30](#) / [60](#) / [90](#) days.
- Champion Tier [Top 5%](#) / [Top 10%](#) / [Top 20%](#).
- Agent Toggle [Exclude Agents](#) / [Include Agents](#); persisted default is [Include Agents](#).
- Ranking Signals [Agent Usage](#) / [Copilot Actions](#) / [M365 Activity](#).

Key relationship: M365Usage[UserId] —M:1—> EntraUsers[userPrincipalName] (bidirectional). All helper tables are disconnected — they reach the model only via SELECTEDVALUE() in DAX measures.

# Page-by-page walkthrough

M365 Usage Dashboard — Interpretation Guide

Key takeaways

- Purpose Tenant snapshot of M365 adoption, workload activity, and Copilot reach.
- KPI row Active users, Teams, email, documents, Copilot users, and departments.
- Top Apps Compare workload volume and action mix across Microsoft 365.
- Read it A wide M365-to-Copilot gap signals an enablement opportunity.

Key takeaways

- Cards Total users, active M365 users, total actions, and average actions per user.
- Workload mix Compare ranked app volume and each app's share of activity.
- Trend line Follow activity by app across the selected date range.
- Tier table Read user distribution across Top 10%, 10–25%, 25–50%, and Bottom 50% bands.

# How the Composite Score Works

## Score Calculation

Each user receives a percentile rank within each M365 app relative to all other users. A score of 80 means more active than 80% of peers in that app. The composite score is the weighted average of these per-app percentiles.

## Profile Presets

- **Balanced:** Equal weights across Teams, Outlook, Word, Excel, PowerPoint — good for general licensing decisions.
- **Collaboration Focus:** Heavy weight on Teams and Outlook — best when your Copilot rollout prioritizes meeting and email productivity.
- **Content Creation:** Heavy weight on Word, Excel, PowerPoint — best when document workflow productivity is the primary goal.
- **Custom:** You set the weight for each app manually. Weights do not need to sum to 100.

## Action Category Thresholds

- **License First:** Score at or above 90th percentile — license immediately
- **License Next:** Score at 75th-89th percentile — strong candidate for next wave
- **Potential:** Score at 50th-74th percentile — provide enablement before licensing
- **Developing:** Score below 50th percentile — focus on foundational M365 engagement first

## Key Tip

Changing the profile instantly re-ranks all users. Use this to model different licensing scenarios before committing to a wave. Try running Balanced, Collaboration Focus, and Content Creation profiles and compare which users appear in License First across all three — those are your safest first-wave candidates.

Key takeaways

- App Selection Choose which M365 app drives the activity percentile.
- Cohort buttons Enablement Targets, Champions, AI-First, and Low Engagement.
- User table Compare selected-app percentile, Copilot gap, prompts, and per-app activity.
- Enablement Targets High M365 use with lower Copilot use; prioritize training and activation.
- Read it Use the actual buttons and table to move from cohort definition to named action lists.

# Page 5 • Priority table (Enablement Targets)

| Enablement Targets | user165@example.com | Engineering      | 100%                 | 100%    | 47             | 26              | 54    | 35      | 7    | 7   | 7     |
| Enablement Targets | user168@example.com | Legal            | 100%                 | 100%    | 47             | 26              | 53    | 36      | 7    | 7   | 7     |
| Enablement Targets | user171@example.com | Customer Service | 100%                 | 100%    | 47             | 26              | 50    | 39      | 7    | 7   | 7     |

## Enablement Targets

High M365, low Copilot — best training candidates

## Champions

High M365 + high Copilot — peer advocates, advanced training

## AI-First

Low M365, high Copilot — Copilot-native users

Low Engagement

Low on both — need broader engagement

M365 All Apps

Teams

Outlook

Word

Excel

PowerPoint

Copilot

## Key takeaways

- Persisted defaults 90-day lookback • Top 20% Champion Tier • Include Agents.
- Validated result 37 Champions at threshold 39.
- Intensity 68.6216 average actions per Champion, or 2.0× the tenant active-user average.
- Agent signal All 37 validated Champions are agent-active.
- Tables Review ranked Champions and department concentration before selecting peer advocates.

Glossary & Metric Definitions

Reference guide for all metrics, measures, quadrant definitions, and terminology used throughout this report. Use this page to understand how data is calculated and interpreted.

**KEY METRICS & MEASURES**

- Active Users**  
Count of unique users with at least one M365 app activity event in the reporting period. Sourced from Entra ID + usage logs.
- Teams Activity**  
Sum of Teams messages sent, read, and meetings joined across all active users. Includes chat, channel messages, and

**ACTIVITY TIER DEFINITIONS**

- Tier 1 - Top 10%**  
Highest-activity users. Champions and power users across all M365 applications.
- Tier 2 - 10-25%**

**USING THIS REPORT**

- Info Icons:** Hover over the blue ⓘ button on any page for contextual guidance and metric explanations.
- Export Data:** Right-click any visual → Export data to download the underlying data as CSV or Excel.
- Filters & Slicers:** Use dropdown slicers (Department, License Status) and app chip filters to narrow your analysis.
- Navigation:** Use the bottom navigation buttons or the page tabs to move between report sections.
- Cross-Filtering:** Clicking a bar, quadrant, or table row will cross-filter related visuals on the same page.

**COPILLOT ENABLEMENT QUADRANTS**

- Q1 — Enablement Targets (M365 ≥ 50th, Low Copilot < 50th)**  
Power users who are highly active in M365 apps but have not yet adopted Copilot. These are your best training candidates — they already understand the tools and will see the fastest productivity gains from Copilot enablement. Action: Prioritize for Copilot license assignment and targeted training.
- Q2 — Champions (High M365 ≥ 50th, High Copilot ≥ 50th)**  
Strong M365 users who are also active Copilot adopters. These users are natural peer advocates, leverage them to mentor others, identify high-value use cases, and lead adoption workshops. Action: Engage as Copilot champions; gather feedback for best practices.
- Q3 — AI-First (Low M365 < 50th, High Copilot ≥ 50th)**  
Users with lower traditional M365 usage but high Copilot engagement — Copilot-

**DATA SOURCES & METHODOLOGY**

- Usage Data:** Microsoft Graph API — M365 usage reports (Teams, Outlook, OneDrive, SharePoint).
- User Data:** Microsoft Entra ID (Azure AD) — user profiles, department, license assignments, account status.

Key takeaways

- **Purpose** In-report definitions for metrics, tiers, cohorts, controls, and data sources.
- **Use it** Resolve calculation and interpretation questions during stakeholder reviews.
- **Scope** Read definitions alongside the active report filters and selected date window.

## Key takeaways

- **Engagement** Compare active days per user and engagement-segment distribution.
- **License view** Contrast average active days for licensed and unlicensed users.
- **Workload view** Compare Teams, Outlook, Word, Excel, and PowerPoint activity.
- **Read it** Use engagement depth with workload mix to target enablement by cohort.

# Methodology

M365 Usage Dashboard — Interpretation Guide

## Composite score formula

```
composite =  
  (Teams_count      × Teams_weight)  
+ (Outlook_count    × Outlook_weight)  
+ (Word_count       × Word_weight)  
+ (Excel_count      × Excel_weight)  
+ (PPT_count        × PPT_weight)  
+ (CopilotChat      × CopilotChat_weight)
```

Weights are read from LP Weight Profiles (or, for Custom, from the six sliders). They should sum to 1.0 — if Custom weights don't, the composite scales accordingly.

## Two percentile patterns

- **LP Composite Score Stable** DAX rank against the entire tenant, using ALL(EntraUsers) and ALL(M365Usage). Thresholds stay anchored to tenant-wide values — slicers don't move the bands.
- **CE Copilot Percentile** Pre-computed in Python and shipped as CECopilotPercentile\_L30 / \_L60 / \_Full. As of v2.6.1, basis is PromptCount from SessionStats.csv, not raw audit events.

# Methodology • Prompts vs. events

The pipeline tracks two related but very different volumes.

## EventCount

**Audit log (one per rollup row)**

Sensitive to inflation — agent fanout, retries, plugin chains can multiply 100×+.

## PromptCount

**SessionStats.csv (one per isPrompt=TRUE)**

Mirrors what a human typed — resistant to service-principal and chain noise.

## Canonical Copilot Prompts measure (Optimizer + Champions pages)

**Copilot Prompts = SUM('M365CopilotSessions'[PromptCount])**

No AppHost filter is applied — SecurityCopilot prompts are intentionally included to match the published template behavior.

# Methodology • Inactivity vs. lookback windows

Two independent time controls on the Optimizer page — don't conflate them.

## Inactivity Window

Defines who counts as INACTIVE in the left table (v\_tbl\_reclaim).

30 / 60 / 90 days • defaults to 90

## Lookback Window

Defines the activity tally for ranking in the right table (v\_tbl\_assign).

30 / 60 / 90 days • separately controlled

### Why two controls?

So you can ask: 'Reclaim seats from anyone inactive 90 days, and assign them to whoever was most active in the last 30.' Keeping them separate gives reviewers more nuanced license-recovery scenarios.

# Data pipeline • Python v2.6.1 outputs

Default rollup mode produces four CSVs from a Purview audit-log export.

| File                     | Content                                                              | Used by               |
|--------------------------|----------------------------------------------------------------------|-----------------------|
| *_Rollup_<ts>.csv        | 14-col aggregated event facts                                        | M365Usage             |
| *_UserStats_<ts>.csv     | 66-col per-user metrics + CE percentile ranks                        | EntraUsers enrichment |
| *_SessionCohort_<ts>.csv | 3-col per-(user, app) session bucket                                 | Cohort visuals        |
| *_SessionStats_<ts>.csv  | 8-col per-(user, date, AppHost) incl. PromptCount + AgentPromptCount | M365CopilotSessions   |

Refresh command (one-line, all 4 Purview pulls):

```
python Purview_..._v2.6.1.py --input Teams.csv Outlook.csv Files.csv Copilot.csv --output-dir ./out
```

# Questions?
